I've been a fan of Elements for a while. In fact, I've put practically every version since using it in the early days. But since I've found out about and tried several new features, it's a whole new game!

- Starts working directly from a RAW file, then presents you with a "collection of tools", including panels and the Layers window, which allow you to edit all modifications applied to the image, even while you're working. I thought this would be a great feature.

- Profiles are integrated directly from the Develop module. It's very easy to save and apply them. Very useful.

- "Photoshop skills are not required"! I'm a developer and this magic is done for you, with embedded tools that simplify the most common processes, such as cloning and resizing. The panel even takes (optional) object and spot corrections from RAW files.

- One of the best improvements is "What should I name this project". You can do basic naming, but can also upload your project to Behance, Google, or similar hosting service. Users can even add metadata, so you don't need to upload your images to an online gallery each time. (I tested this feature using a Behance account.)

- Develop preview (and to a certain extent, adjustment panel) and Develop modules are shown in a floating tab. This is helpful and saves time. The new one-click Delete and Fill tools are powered by new neural network technology advanced by Adobe Sensei AI. When enabled, this technology senses the shapes, colors, and compositions of sections of an image, and can identify scenes and scenes of any complexity. The AI powers the selection tools in Photoshop, delivering unprecedented accuracy and precision for more intelligent selections. If you are an expert Photoshop user, you will find this new technology impressive. However, if you have not spent significant time using it, you might find the effect a bit strange at first. For me, it has been a confirmation of the need of AI advancement in photo editing tools. For those thinking of switching to CS6, add Adobe Sensei AI to your cart like it is an add-on. In the future, this technology will likely be available on the Web. There are many advantages to this type of AI-powered tools, not the least of which is that they can perform many of the same functions as the desktop version of Photoshop in a browser. The new selection tools and smart enhancements are powered by Adobe Sensei AI. It is based on deep learning and machine learning. It comes with many new features like object recognition, and pixel inference. This new technology helps it know what it can recognize. It is not just limited to recognizing objects, but also tells the tool what to do with a selected object. For instance, if there is a mask, input mask, or content aware mask to apply to the highlighted object that can be edited using one of the brush options.

The very first Photoshop had trouble making buttons big and flashy. People generally got the idea that what they were using was not what a true Photoshop would look and feel like. Also, the small number of buttons made it difficult to select things. Nowadays Windows and Mac users would disagree that Photoshop needs a button to maximize the screen, as it would also maximize the window. In an earlier version, there was no way to drag out the image to change the size. Photoshop is almost as important as the web browser itself. Netscape, its first competitor, was eventually forced to be acquired by AOL, a former employer of Knoll's. Now Netscape and AOL are only a piece in the puzzle of web browsing. The modern web browser is called Internet Explorer, probably named after Netscape, and the very first web browser, NCSA Mosaic, was developed by Marc Andreessen, who also founded Netscape. Adobe Photoshop was introduced in 1989 at \$500 to compete with the advanced PostScript Imaging Device (PSID) on Apple Computer's LaserWriter. Adobe released their design software for PCs, but advertised Apple as their strong competitor. Within two years after the introduction of the program, Apple introduced a version of Photoshop themselves as part of their MacPaint package. This created one of the most successful pairs of competing products: PC Photoshop vs. Mac Photoshop. Now the battle was on between the two most important platforms of image editing: Macintosh and PC. <http://www.paperstreet.com/2001/april/the-birth-of-direct-mail-marketing-for-more-with-photoshop.html> Personally I think the whole advertising industry benefited through the medium of Photoshop. Many people have mentioned this in their blogs such as custan kitchen . it is quite true and one of the main reason why I continue to use and purchase all version of photoshop through the years. Also it is worth the price of the entire package of Photoshop, Adobe Illustrator and other programs Adobe offers.
